### **ENERGY STAR® CHECKLISTS OF ENERGY-SAVING MEASURES**

By: Alyssa Holmes, Public Service Company of Oklahoma

Commercial buildings can use a large amount of energy during operations. Even the smallest actions such as leaving a light on or altering a process can have a huge impact on energy output. Finding your largest energy users is extremely helpful when looking to make your business more energy efficient and ultimately adding savings to your bottom-line.

A good first step is to use a [check list](#) from ENERGY STAR to get you started. This checklist has low-cost energy efficient measures that can be completed within a commercial building. A few of the measures that are mentioned are lighting, heating and cooling, plug load, and even rapid payback measures.

So, if you're looking to find ways to save while you're operating your business, use this energy checklist to start saving and don't forget to get your team involved too!
